Corning® BioCoat™ high content imaging glass bottom microplates are ideal for performing cell-based imaging assays where cell attachment or retention may be an issue with a standard glass microplate. The BioCoat high content imaging microplates are available pre-coated with rat tail collagen type I, human fibronectin, or poly-D-lysine.

Benefits

- Uniform and consistent coating for improved cell attachment and even distribution, or spreading of cells
- High optical clarity and scratch-resistant glass
- Glass bottom thickness of 200 µm is well-suited for imaging microscopy
- Well bottom flatness <50 µm to ensure planarity for imaging devices
- Low background fluorescence and minimal crosstalk to provide outstanding optical quality for cell-based assays

Application

Glass bottom microplates have historically been viewed as the gold standard for high content cell-based assays because of the high optical clarity, flatness, and scratch resistant properties intrinsic to glass. Conversely, the natural hydrophobicity of glass may cause adherence issues with some cell types. In those cases, cells may benefit greatly from a protein coating to aid in cell attachment, spreading, and/or functionality. Studies described here demonstrate that Corning BioCoat high content imaging glass bottom microplates provide improved cell attachment, spreading, and retention.

HepG2 cells were seeded on uncoated and collagen-coated high content imaging glass bottom microplates. Cells cultured on the uncoated glass microplates were clumpy and displayed an uneven distribution compared to cells cultured on the collagen-coated microplates. (Figures 1 and 2). As a result, cells cultured on the uncoated plates exhibited statistically lower cell counts when analyzed using a high content imager (data not shown).

In a separate experiment, HEK-293 cells were seeded on fibronectin and collagen-coated glass microplates. After multiple washes, a greater number of cells were retained on fibronectin and collagen-coated glass microplates when compared to the uncoated microplates (Figure 3).

For more details on this experiment and other assays performed using Corning BioCoat high content imaging microplates, please refer to Corning document CLS-AN-244.

Warranty/Disclaimer: Unless otherwise specified, all products are for research use only. Not intended for use in diagnostic or therapeutic procedures. Not for use in humans. Corning Life Sciences makes no claims regarding the performance of these products for clinical or diagnostic applications.

At Corning, cells are in our culture. In our continuous efforts to improve efficiencies and develop new tools and technologies for life science researchers, we have scientists working in Corning R&D labs across the globe, doing what you do every day. From seeding starter cultures to expanding cells for assays, our technical experts understand your challenges and your increased need for more reliable cells and cellular material.

It is this expertise, plus a 160-year history of Corning innovation and manufacturing excellence, that puts us in a unique position to offer a beginning-to-end portfolio of high-quality, reliable cell culture consumables.

For additional product or technical information, please call 800.492.1110 or visit www.corning.com/lifesciences. Customers outside the United States, call +1.978.442.2200 or contact your local Corning sales office listed below.
