The building access terminal (BAT) makes things easier for fibre optic distributors and integrators also. Because it is modular, they can buy the BAT’s components separately and then assemble them in the desired configuration for the telecommunications customer. The world’s leading distributors and integrators leverage the functionality of the BAT to provide additional value to their customers.

Shown above, a configuration example of the BAT: LC duplex patch module, splice module for crimp splice protectors, over-length storage, cable entry section module and cable strain relief.

For more information about the BAT, visit www.corning.com/emea/en/bat
