ULE® Corning Code 7972
Ultra Low Expansion Glass
Advanced Optics and Materials

ULE® Corning Code 7972 Ultra Low Expansion Glass is a titania silicate glass with unique characteristics that have made it the material of choice in applications ranging from machine tool reference blocks to solid and lightweight mirror blanks for large astronomical telescopes and space satellite applications. It is formed as 1.5-meter boules from which virtually any size or shape product can be made.

Near Zero Thermal Expansion is the key attribute for which system designers specify Corning ULE®. This material offers superior dimensional stability:

- Coefficient of thermal expansion (CTE) is nominally zero at room temperature
- Expansivity can be adjusted to provide zero CTE at other temperatures when needed for specific applications
- High homogeneity of CTE within boules enables efficient material utilization
- CTE is nondestructively measured on all ULE® boules, enabling precision engineering and analysis of the thermal response of products in the end use environment

Fabrication Flexibility is the key to product design freedom. Corning utilizes several key manufacturing processes which enable the production of a variety of products:

- Monolithic solids from a few centimeters to over 8 meters in diameter
- Lightweight fusion bonded structures offering up to 80% weight reduction over the same sized solid
- Ultralightweight frit bonded structures with up to 95% weight reduction are possible using a proprietary glass ceramic frit designed to closely match the thermal expansion of ULE® glass.
CTE Variation and Inclusion Quality Grades

Mean Linear Coefficient of Thermal Expansion (CTE)
The guaranteed maximum limits for the mean linear CTE are as follows:
The mean linear CTE shall be $0 \pm 30 \text{ ppb/}^\circ\text{C}$ from 5°C to 35°C with a 95% confidence level.

- Inclusion max mean diameter:
- Inclusions per cubic inch:
- Avg. no. of inclusions per cu. in.:

Special grades and sizes available on request

- CTE verification is performed using a non-destructive ultrasonic method.
- Excellent long term dimensional stability is exhibited at room temperature. No residual figure change is observed when taking an optic from 350°C to water quench.
- There has been no measurable delayed elastic effect. This is an important consideration when large strain is present during fabrication or when environmental loading is present, such as during gravity release or dynamic control of active optics.
- No measurable hysteresis results from thermal cycling.

### Chemical Durability

- Excellent resistance to weathering
- Exhibits virtually no surface clouding or electrical surface leakage when subjected to attack by water, sulfur dioxide, and other atmospheric gases.
- High resistance to attack by nearly all chemical agents.
